Abstract

In industry, prognostics and health management are key topics for anticipating asset state and avoiding downtime and breakdowns. Runto-Failure simulation data from turbofan jet engines is included. The C-MAPSS software was used to simulate engine degradation. Four separate sets of operational conditions and fault modes were simulated in four different ways. To characterize fault progression, record numerous sensor channels. The Prognostics CoE at NASA Ames provided the data set. The main goal is to predict the remaining useful life (RUL) of each engine. RUL is equivalent of number of flights remained for the engine after the last data point in the test dataset.

1.Introduction

Why this Low-Level Design Documentation?

The purpose of this documentation is detailed description of restaurant rating prediction system which will explain the purpose and the feature of the system, the interfaces of the system, what the system will do, the constraints under which it must operate and how the system will perform under different parameters. This document is intended for both the stack holders and developers of the system and will be proposed for the higher management for its approval.

This project can be delivered in three phases

Phase 1: Building Machine learning model depending on the requirements.

Phase 2: Integration of UI and database to all the functionalities.

Phase 3: Deployment of project on cloud.

Scope

This software system will be a web application, this system will be designed to predict the RUL based on user's input.

Constraints

This project is based on Aero space domain, this system can get excepted results.

Out Of Scope

System will not perform correctly if the data in good format

2. Technical Specifications

Data: Predictive Maintenance

Finalized: Yes

Data Set overview

20631 rows

memory usage: 4.4 MB
```

Predicting

- The system displays RUL according to user's Input.
- The system prevents the set of inputs required from the user.
- The user gives required information.
- The system should able to predict the RUL According to the user input given.

Logging

√ We have chosen File logging.

✓ System logs each and every system flow.

✓ Each and every user's input information is logged.

Database

The system stores each and every data given by the user or received on request to the database. We have used Cassandra.

Deployment

1. AWS

2.Technology Stack

- * Python
- * Stream lit
- * Python Libraries
- * Machine Learning algorithms

3. Proposed Solution

This system requires some sensor column values.

4 .Model Training / Validation Workflow

5. User I/O Workflow

6.Test Cases.

| Test Case | Pre-Requisite | Expected Result |
|---|--|--|
| Description | | |
| Verify whether the Application URL is accessible to the user | Application URL should be defined | Application URL should be accessible to the user |
| Verify whether the Application loads completely for the user when the URL is accessed | Application URL is accessible Application is deployed | The Application should load completely for the user when the URL is accessed |
| Verify whether user is able to edit all input fields | Application is accessible User is logged in to the application | User should be able to edit all input fields |
| Verify whether user gets Submit button to submit the inputs | Application is accessible User is logged in to the application | User should get Submit button to submit the inputs |
| Verify whether user is presented with recommended results on clicking submit | Application is accessible User is logged in to the application | User should be presented with recommended results on clicking submit |
| Verify whether the recommended results are in accordance to the selections user made | Application is accessible User is logged in to the application | The recommended results should be in accordance to the selections user made |
